‘Look at you!’: Disembodiment between ugly bodies and able minds.

Abstract

Evidence points to embodiment being perceived as a lived human experience that bridges the natural and the cultural. Therefore, embodied social identities seem to be related with the way people perceive their body as beautiful/ugly, namely worthy/not worthy. Using data from interviews with employees with disability, this paper explores the process of shaping the body within the post-colonial masculine organizational culture. On these grounds, we argue that the above process involves taking decisions at three levels: firstly, one must decide what their body is, secondly, define what their body can be and thirdly, assume what their body will be. Further, the data revealed how those with “ugly bodies” construct their identities in relation to non-disabled colleagues. Our theoretical and managerial contribution includes a better understanding of how workplace and social life tend to be organized based on the ideal (able) body.

Keywords

Ugly body, disabled people, symbolic embodiment, social exclusion, bodies in organizations

Introduction

A growing body of literature critically examines disabled people’s experiences of work revealing importance of understanding the social relational aspects of embodiment, disability and ableism within organizational contexts (Williams and Mavin, 2012). Despite evidence of gendered aspects of disability (Haynes, 2012; Warner and Brown, 2011), its relationship with employment and gender remains under-researched, with accounts of experiences of disabled employees to be relatively scarce in the disability studies literature.

Drawing on feminist theories, Thomas (1999) has manifested the epistemological value of

1
2
3 recognizing individual experiences of disabled people as reflections of the macro social world.
4
5 Additionally, dis/ability and the fe/male should not be viewed individually or as dichotomies,
6
7 considering their relational characteristics (Goodley, 2013). These models are aligned with
8
9 approaches of identity, which have diverged from considering individuals and identities as
10
11 separate from the social world (Collinson, 2003). Instead, identities are socially constructed
12
13 and relational, with the workplace a key place where this takes place.
14
15
16
17

18 Besides its functional role as part of the eco-system, the human body is present at the very core
19
20 of a range of different embodied phenomena, which take place in the micro and macro social
21
22 environment. Thus, the body is a social actor that experiences the world and a tool that may be
23
24 used to identify and distinguish a person from the others (Hamermesh, 2011; Simpson and
25
26 Pullen, 2018). Even though the internal anatomy and the biology of the body are about the
27
28 same for the humankind, the external appearance may deviate from what is considered the
29
30 norm. In addition, the norm is not the same across time and space; in contrast, personal and
31
32 environmental factors such as culture, beliefs and stereotypes affect what is considered as the
33
34 ideal body (Shilling, 2017). Thus, the acceptable shape and appearance of the human body have
35
36 always been a hot spot, in the center of popular discussions. As a result, the body became the
37
38 means to construct, revise and finalize one's identity; the development of identity though
39
40 depends not only on how the body looks, but on how the owner of the body feels, and on what
41
42 others think about it (Mays, 2006).
43
44
45
46
47

48 Feeling good about their body has been a long-standing goal for many people, since having a
49
50 considered as acceptable body is related to increased self-confidence and self-esteem, extended
51
52 social relations and -very often- better jobs (Szymanski and Parker, 2010). For this reason,
53
54 people may focus on shaping their body so as to approach as closer as possible the allegedly
55
56 ideal body. To this end, people usually compare their bodies to what is considered 'normal' in
57
58 a society; then they decide what they need to do in order to shape their bodies, i.e. make them
59
60

1
2
3 like, or at least look like, the desired body, as imposed by the social norms (Heiss, 2011).
4
5

6 However, shaping the body, in order to reach the norm, is not always an option for all people.
7
8 Thus, for some people such as some disabled people, having a body that is considered not
9
10 'normal' may be an unavoidable situation (McLaughlin and Coleman-Fountain, 2014). Thus,
11
12 albeit not always, disability can produce a different kind of body, which is considered as
13
14 lacking and needing repair if a 'good' life is to be made possible (Phillips, 1990). In addition,
15
16 the impaired disabled body, i.e. the body that is considered less than whole, may be identified
17
18 with the ugly and not worthy body in many cultures (Ghosh, 2010), including Cyprus
19
20 (Symeonidou, 2009). Yet, the pressure to look 'whole' and beautiful, so as to become
21
22 acceptable and worthy, and thereby get access to the 'dream world of the beautiful bodies',
23
24 where there are better jobs and more opportunities for participation in social life, may be
25
26 overwhelming for disabled people (Turner, 1996).
27
28
29
30
31

32 Drawing on both postcolonial and disability theory, we consider the proposition that ideas of
33
34 such a normalized beauty underpin both disability and colonialism in Cyprus (Netto, Noon,
35
36 Hudson, Kamenou-Aigbekaen and Sosenko, 2020). Colonialism privileges white, masculine
37
38 perfection and wholeness in the same way that it can be perceived to engender the white man
39
40 as the 'benchmark man' (Campbell, 2009: 111) for physical ability and normalcy. We argue
41
42 that the process of shaping the body involves taking decisions at three levels: firstly, one must
43
44 decide what their body is, secondly, define what their body can be and thirdly, assume what
45
46 their body will be. We focus on **this disembodiment that appears to exist between the ugly,
47
48 disabled body and the beautiful, able mind**, who does not fit the expectations of the norms of
49
50 the contemporary post-colonial masculine workplace (Georgiadou and Antonacopoulou,
51
52 2020). On these grounds, this study aims to explore the implications of having an ugly body in
53
54 the professional world by giving voice to adults labelled as having an ugly body as disabled
55
56 people. Our theoretical and managerial contribution include a better understanding of how the
57
58
59
60

1
2
3 post-colonial, masculine workplace and social life tend to be organized based on a universal
4 (able and thereby worthy) body, thus emphasizing and promoting a disembodiment between
5
6 body and mind. In order to break the cycle of disablement in work and society and fill the gap
7
8 beyond masculine post-colonial conceptions of worthiness at work, other layers of the body
9
10 deserve to be explored in-depth, such as the bifurcation of beautiful-worthy vs ugly-not worthy
11
12
13
14
15 body.

16
17
18 The critical analysis of the above entanglement is important, because of the theoretical and
19
20 practical implications: at the theoretical level, the tensions between the perceived as beautiful
21
22 and the labelled as ugly body could bring us closer to a comprehensive understanding of the
23
24 experience of being excluded because of being different; at the practical level, the knowledge
25
26 about the embodiment of perceived as worthy employee and citizen may lead managers to use
27
28 the above knowledge in real work settings to manage effectively diversity and promote equity,
29
30 as a social action of inclusion.
31
32

33
34
35 Therefore, this study explores three questions: (a) Who defines what the disabled body is? (b)
36
37 How disabled people shape their body and embodied self in order to fit into social and work
38
39 life? (c) What are the implications of acknowledging a disabled body as ugly?
40
41

42 **Conceptualizing the (dis)abled body**

43
44

45
46 Scholars are reconsidering the ontology of disability and present it as a constructed difference
47
48 formed through social interactions, interpretations, or practices. This represents the so-called
49
50 social relational model, whereby disability is not conditional on an impairment, but rather it is
51
52 relational and dependent on relationships and interactions with others. According to Bourdieu
53
54 (1984), social action takes place in a field, which represents the dominating system of power
55
56 relations. Social positions in the field are not randomly allocated; in contrast their availability
57
58 is depended on constraints and rules imposed by the most powerful. Extending the above
59
60

1
2
3 notion, we may assume that some disabled people are marginalized and pushed down to the
4
5 lowest level of social hierarchy, as not 'fitting' the ideal body/worthy person (Shilling, 1991).
6
7 The displacement of disabled people with impaired bodies then is evident not only in the
8
9 workplace but also in family and personal life (Morris, 1999). Importantly, as Bourdieu (1984)
10
11 argues, displacement may eventually become habitus, i.e. a long-lasting scheme of perceptions,
12
13 which recycles the social order and reproduces unequal relations. When bodies are perceived
14
15 as deviating from the (able) norm, they are often treated as problematic and disturbing the
16
17 social order (Heiss, 2011).
18
19
20

21
22 A common route to overcome the consequent exclusion of the deviant/disabled body is to
23
24 pursue medical intervention, aiming to achieve a better fit with norms of embodiment
25
26 (McLaughlin and Coleman-Fountain, 2014). As a result, according to Davis (1995), medicine
27
28 has developed the 'concept of the disabled body', according to which bodies are positioned as
29
30 either normal and 'healthy' or abnormal and in need of medical interventions and treatment.
31
32 The above normality is a product of medicine and therefore is actually fictional. However,
33
34 many disabled people regulate themselves according to the prevalent masculinist approach of
35
36 being responsible to be a healthy and productive citizen and thereby satisfy the needs of the
37
38 neoliberal, post-colonial market (Holt et al., 2012); an approach clearly centered around
39
40 embedded masculine values and assumptions within the organizational culture.
41
42
43
44
45

46 The body was initially defined in the context of the Western philosophical tradition, as an
47
48 absolute 'objective' biological entity, and relied on the dualism between body and spirit; a
49
50 polarity through which Descartes attempted to exempt the individual from the embrace of
51
52 religious power (Rozemond and Rozemond, 2009). Body's physical basis defined it as an entity
53
54 that, like the rest of nature, may limit human rational act. Then the human sciences, based on
55
56 the distinction of body-mind, matter-spirit, real-non-real, scientificized body; thus, its
57
58 biological, 'objective' status was legitimized as the only 'real'. The human body was identified
59
60

1
2
3 through its biological existence; hence anatomy was the certification of this ‘objective’ reality
4
5 (Foucault, 1973). Foucault felt that we cannot trust the subject’s gaze, as we know or see only
6
7 what the language allows us. Like all forms of human knowledge, scientific discourse is a
8
9 collection of metaphors, a great narrative, same stands with the coveted body. The language
10
11 itself, based on conventionalities that have historically been adopted, arbitrarily describes the
12
13 world. Different societies and different macro-environments have different conventionalities
14
15 and therefore different realities (Turner, 1996). These views lead to the relativization of
16
17 scientific medical knowledge. Thus, disability is not a normal ‘objective’ event, but a product
18
19 of medical discourse highly context-related, which comes from the space-time specific
20
21 language; in turn, disability reflects the dominant way of thinking, that of science, which in a
22
23 Western, post-colonial environment, is driven by the prevailed masculine values . Access to
24
25 scientific, therefore valid, knowledge gave doctors the opportunity to exercise power and
26
27 determine what is disability (pathological) and what is non-disability (normal) (Williams and
28
29 Mavin, 2012).

30
31
32
33
34
35
36 Although across time and space the ideal body was constructed in different ways, ableness and
37
38 beauty have been common characteristics of the coveted body since ancient times. Thus, the
39
40 able and beautiful body, known as *kallos* in ancient Greek, was considered as a fundamental
41
42 virtue of the good and kind (*kalos kagathos*) citizen. *Kallos* constituted one part of a sacred
43
44 triad, which included valor (*andreia*) and wisdom (*sophia*) as the other two fundamental virtues
45
46 (Sachs, 2006).
47
48
49

50
51 In recent times, as early as 1956, the concept of elegance has been recognized as a global term,
52
53 but the standards of comparison associated with an ideal aesthetic, can be defined quite
54
55 differently in different cultural contexts (Seymour-Smith, 1987). Therefore, cultural relativity
56
57 in terms of the concept of beauty can be elucidated considering that in a given society, specific
58
59 standards or formal characteristics that describe beauty can be recognized; these standards are
60

1
2
3 incorporated through experience in the society in which they are expressed, and are also
4
5 influenced by socio-cultural values and ideals. It could be argued that these hitherto
6
7 conceptualizations, rely upon a masculinist approach of how those standards are generated and
8
9 further promoted (Sang and Calvard, 2019).
10
11

12
13 In this vein, a significant body of feminist research demonstrates a direct or indirect relationship
14
15 between the embodiment of the nature and meaning of beauty and the social experience. A
16
17 plethora of authors (e.g. Banet-Weiser and Portwood-Stacer, 2006; Whelehan, 1995) address
18
19 beauty drawing on the evolutionary perspective, emphasizing beauty's socially rewarding
20
21 nature. Much of feminist thinking about beauty, however, deals with the dilemma of
22
23 conceptualizing it as a phenomenon that promotes empowerment or oppression, usually of
24
25 women. Postcolonial feminist theory highlights how the construction of masculinity stems
26
27 power through imposing practices and processes of regulating and signifying (able) bodies;
28
29 confirming that beauty (and therefore ability) lies at the core of postcolonial mastership
30
31 (Saraswati, 2011).
32
33
34
35
36

37 The emergence of the second feminist movement has brought out an interest in how perceptions
38
39 of the female body affect women's lives (Shilling, 2012). The social construction of women's
40
41 bodies is the process through which perceptions of female bodies are formed and socially
42
43 accepted. This process is essentially a political process that reflects, strengthens or contradicts
44
45 the distribution of power between men and women. According to Foucault, a powerful array
46
47 of disciplinary practices – internalized and external – is used to produce 'obstinate bodies',
48
49 which willingly accept this social control. However, the person should not be considered a
50
51 passive victim of these disciplinary practices. On the contrary, they may actively cooperate or
52
53 resist their creation and preservation (Weitz, 1998).
54
55
56
57

58 Thus, we observe a theoretical dipole: on the one hand, there are feminist approaches, which
59
60

1
2
3 are mainly linked to the 'second-wave feminism' and treat beauty as a source of oppression,
4 criticizing normalized beauty practices (Whelehan, 1995). On the other hand, through a mainly
5 post-feminist perspective, beauty is treated as a legitimate means of empowerment and
6 satisfaction (Banet-Weiser and Portwood-Stacer, 2006). The body is at the heart of a variety of
7 different and contradictory thoughts and considerations: it is familiar but at the same time alien.
8 In the context of this contradiction, the body is approached both as a creation of various words
9 and practices as well as a material entity, a source of experience and emotions, a place of desires
10 and mediation of social expectations. The 'stigmatized' body is not sufficiently investigated
11 until it acquires 'materiality', when the interest in it is rekindled mainly through the lens of
12 phenomenology, post-colonialism and feminist theory (Merleau- Ponty, 2012; Foucault, 1991,
13 1998; Butler, 1993; Grosz, 1994; Bordo, 1995).

60
In the context of postmodernism, the body is perceived as something that is formed and
reconstituted through constant modifications and redefinitions (Shilrdick, 2015). The new
postmodern body is self-made. People are given means to transform their bodies into what
seems ideal to everyone. The body is reconstructed according to cultural standards for natural
beauty and natural perfection. So, the postmodern urge towards body perfection and self-
improvement is not only a personal (internal) drive but also a cultural (external) pressure.

Since beauty was eventually identified with the desired and worthy, ugly became synonymous
to having negative characteristics (Heiss, 2010). Looking back in ancient philosophy,
Aristotle's ideas in 'About Poetry' (*Peri Poiitiki*s, 1450b.36) that deviation from the norm can
never be beautiful may be considered still timely. As the above philosopher explains, the
beautiful cannot be anything else, but only normal and harmonious, because when something
is less, it is not visible; likewise, when something is more, it is confusing and distracts the unity
of the whole vision (Sachs, 2006). Likewise, contemporary social practice regarding disabled
people seems to reproduce the above thinking, by assuming that the body that deviates from

1
2
3 the norm is ugly and not worthy, because it is either insignificant or annoying; therefore, it
4 should be placed somewhere of less value, where all not worthy things and people are placed
5
6 (Morris, 1999). In the case of disabled people, this place is the low level of social hierarchy,
7
8 where people are less-privileged, usually employed in low-paid jobs or unemployed and
9
10 deprived from equal access to social life and opportunities, with disabled women placed at the
11
12 lowest level (Morris, 1999).
13
14
15
16
17

18 From a philosophical point of view, Plato in his dialogue *Phaidros* (250b-d) discusses further
19
20 the concept of ugliness, postulating that people, who are disrespectful towards beauty,
21
22 eventually lose it. Losing beauty is a misery for Plato, since beauty is the means for keeping
23
24 the mind and the spirit in transcendent areas. Even though Plato underlies the dual nature of
25
26 beauty as a visual and spiritual concept, he believes that vision is more powerful than the bodily
27
28 senses; therefore, beauty has the power to render everything bright and loveable. Thus, the
29
30 presence of beauty declares the existence of value, balance, fairness, kindness and all the ethical
31
32 and logical situations. Hence, for Plato, beauty is an indicator of a fair society, consisting of
33
34 conscious and active citizens (Jowett, 2010).
35
36
37
38

39 Ironically, the above notions are still prevalent in many contemporary cultures, where disability
40
41 is translated as ugliness and an indicator of a problematic situation; thus, it is implied that a
42
43 disabled person is a not worthy citizen. Within this framework, many disabled people assume
44
45 that the ugly body needs to be reshaped and transformed, as a means to restore normality and
46
47 get access to the world of able people, where there are more opportunities for better
48
49 employment, richer social life and more likelihood to be attributed value and be included
50
51 (Ghosh, 2010).
52
53
54
55

56 **Disability, embodiment and social and work life**

57
58

59 According to social scientists (e.g. Dale, 2001; Shilling, 2017), the body is essentially a project,
60

1
2
3 which people must manage, based on normative and moral accounts that guide them to alter
4 and shape it accordingly, in order to fit in and become acceptable. In this way, how a body is
5 perceived depends on its conformity with consolidated socio-cultural ideals, which act as
6 control factors and define the permitted social relationships and the expected social status that
7 matches the specific type of body. As a result, the body becomes the measure to determine
8 one's worth and place in the social hierarchy and job market (Dale, 2001). Hence, it may be
9 assumed that shaping the body towards the norm becomes a process of socialization and a
10 means to transcend from a lower to a higher status.
11
12
13
14
15
16
17
18
19
20
21

22 Some feminist scholars have highlighted the importance of viewing beauty through its theory
23 of evolution, justifying it as a biological matter. According to Etcoff (1999), beauty is a
24 genetically granted virtue and therefore unjustly distributed among people. Etcoff agrees that
25 the outward appearance actually has very little to say about a person's intelligence, personality,
26 and abilities; however, she believes it is hypocritical to pretend that the ideal of beauty is a
27 trivial social construct. Much of the literature (e.g. Heiss, 2011; Marks, 2014) highlights the
28 socially rewarding value of beauty, citing the social status and benefits that beautiful people
29 enjoy because of their inherent 'charisma'. This approach supports the beauty-as-worthy thesis,
30 and emphasizes the halo effect, in which attractive appearance is associated with high positive
31 expectations for an individual.
32
33
34
35
36
37
38
39
40
41
42
43
44
45

46 There is an expectation and conviction that beautiful people have more successful personal and
47 professional lives, while beauty premium stresses that people who conform to cultural
48 standards of beauty receive higher incomes than those who do not (Hamermesh, 2011). Beauty
49 is seen as a means by which women, for example, empower their status and dominance in the
50 social class. Beauty plays a role, not only on a personal level, but also on an institutional level,
51 as attractive individuals enjoy greater social benefits in the workplace. On the contrary,
52 unattractive people, who deviate from beauty standards, are more easily stigmatized and are
53
54
55
56
57
58
59
60

1
2
3 more often victims of discrimination at work (Griffin and Langlois, 2006).
4
5

6 In the case of the disabled body, which is often considered as deviating from the norm and
7 being ugly, the intersection of gender and disability results to women being more often
8 discriminated in the workplace and social life compared to men. **Through social relational**
9 **lenses of disability and gender (Sang, Richards and Marks, 2016),** it has been found that
10 although finding a job as a disabled employee is difficult for all disabled persons, for women
11 is even more difficult and stressful. It is also noteworthy that, even though survey data indicate
12 that disabled people in general are under-represented in professional and managerial positions,
13 disabled women are overrepresented in clerical and working from home jobs, which are low
14 paid and socially isolated, or unemployed (Barnes and Mercer, 2005).

23
24
25
26
27

28 According to the theory of social construction (Marks, 2014), disability is neither natural nor
29 necessary, but rather is produced by society. The ways in which we usually perceive the world,
30 the categorizations and the perceptions we have are rooted to a specific historical and cultural
31 context. Social exclusion proves that our values and ways of seeing things are a social
32 construct. This is why light should be shed, not on people with disabilities in general and in the
33 abstract, but rather on how these labels are produced and reproduced during social interactions
34 within established and cultural contexts.
35
36
37
38
39
40
41
42
43
44

45 The construction of models of disabled bodies is based on specific notions of normalcy within
46 a postcolonial masculine culture that differentiate abnormal states from the normal and efficient
47 ones. Drawing on Foucault's work, Tremain (2006: 186), refers to 'dividing practices' that
48 follow the distinction and objectification of types for instance, the abled and disabled, the
49 beautiful and ugly bodies.
50
51
52
53
54

55
56
57 The social model of disability places disability not in a disabled or impaired body, but in a
58 restrictive and repressive social environment. The social model argues that many of the
59
60

1
2
3 restrictions imposed on people with disabilities are not normal or unavoidable consequences of
4 their disability. In contrast, they are produced by a social environment that is incapable of
5 taking into account disabled people (Oliver, 1996). Symbolic interaction views interpretations
6 and meanings as social constructs; as conceptual elements that had been developed through the
7 interpretation of human interactions (Blumer, 1986). The rendering of meanings is not a reflex.
8 Human beings are social entities and thereby meaning develops through interaction and within
9 a specific context.

10
11
12 To use this symbolic interaction perspective in order to conceive the meaning of a situation,
13 one needs to look more at the group defining the object, the history and nature of the provided
14 definition and process of deciding upon that definition, rather than merely the object itself.
15 Theory goes beyond use of “truth”, emphasizing the human experience as something
16 subjective, not absolute. In order to understand and analyze the world, people define the self
17 and their actions. Through this process of defining themselves, people try to see themselves as
18 others see them. Thus, someone’s *self* is a social construct, namely the result of perceiving
19 oneself as an object and then developing self-determination through interaction (Marks, 2014).

20
21
22 Thus, through the symbolic interactive perspective lens, employees with disabilities do not
23 absolutely exist. It’s just a way of thinking and categorizing others. If some disabled people
24 are treated as not able people has to do with the specific way others think about this situation.

25
26
27 The way individuals define themselves around their alleged disability is a function and
28 construct created through interaction. Whether people with disabilities feel ashamed, neutral
29 or proud of their condition and bodies, that is achieved through their social interactions with
30 significant others – family, colleagues, friends (Oliver, 1996). In order to understand the above
31 process then and how the workplace interferes in the process of shaping the self and the body,
32 it is important to listen to the voice of disabled people.

Methods

To address our research questions, we employed a qualitative methodology with the aim to gain in-depth accounts from key informants and thereby reach a better understanding about embodied phenomena. This research was guided by the feminist approach, which emphasizes the dualistic nature of the world (Rose, 1993). We focused on two dualistic counterparts, i.e. beautiful/ugly and worthy/not worthy, trying to inform scientific explanations that might help us understand and transgress the above intersecting bifurcations. Thus, the research explored the ways in which disabled people in Cyprus a) make sense of their body and b) shape their body in order to place it in the workplace, the social context and family. Discussions with the participants focused on what they thought about the characteristics of the coveted body; how they understood the process and the factors that defined the above characteristics; what identity they attributed to themselves; how they experienced their own body; which factors influenced their perceptions about their body; how others reacted to their body; how they shaped their body and why; where they placed their body and why.

Each interview lasted between one to two hours and was based on the informed consent of the participants. A grounded theory method was employed, aiming to develop theoretical concepts through the participants' narratives; thus, the interviews were driven by the participants' perceptions. We started by asking the participants to tell us their stories of disability. Then we used prompts and probes to steer the conversation through the following topics: the cultural aspect of disability, employment of disabled people, relations with family and others, personal identity, the bifurcation of beautiful/ugly and the implications of having a labelled as ugly body. The interviews were tape-recorded and transcribed verbatim. Even though we tried to remain impartial during the interview process, we acknowledge that our female gender and the friendly relations we had with some of the participants may have influenced participants' responses.

1
2
3 Data were analyzed with top-down thematic analysis. Within this framework, analysis was
4 driven by the specific research questions and the analysts' focus. The process was guided by
5 Braun and Clarke's (2006) six-phase framework for doing thematic analysis. Thus, at phase
6 one, we read the transcripts many times so as to become familiar with the data. Then we
7 generated initial codes, each researcher independently. After that we compared and discussed
8 our codes and retained the suitable ones (e.g. body as a source of pain). At phase three we
9 separately searched for themes. At the next phase we discussed and reviewed our themes. At
10 phase five we defined the final themes that represented the participants' experiences and beliefs
11 on the one hand and answered the research questions on the other (e.g. factors related to socio-
12 economic life). Finally, we wrote-up the analysis.

24
25

26 **Sample**

27
28
29
30 Macro-environmental differences (e.g., culture) that influence the experience of embodiment
31 exist between countries. To limit the effects of such institutional factors in our study, we drew
32 our sample from a single country (Cyprus). **In total, our sample comprised of eight disabled
33 people in Cyprus. The sample size is consistent with norms and suggestions for adequate
34 sampling in management studies. Brinkmann and Kvale (2015) suggest that five to 25 people
35 represent an adequate sample for qualitative studies.** Even though we cannot postulate that we
36 selected a representative sample that reflects the enormous range of disabled people's
37 experiences and perspectives, we tried to recruit a diverse group of participants with different
38 backgrounds and socio-economic status. To this end, we employed a combination of purposive
39 and snowball sampling methods. For confidentiality purposes, the participants are presented
40 with pseudonyms.
41
42
43
44
45
46
47
48
49
50
51
52
53
54

55 **Findings**

56
57
58
59 *Who defines what the disabled body is?*
60

1
2
3 According to the participants in this research, the characteristics of the disabled body are
4 imposed by external factors, which are then internalized by disabled people, through the
5 process of socialization (Symeonidou, 2009). In this way, the bifurcation of the
6 beautiful/worthy vs the ugly/not worthy body emerges and becomes a stereotype.
7
8
9

10 11 12 13 *Culture and social stereotypes* 14

15
16 The dominating culture in Cyprus dictates that persons with a deviant body are dangerous
17 because they may have an infectious disease. Hence, they ought to be isolated, unless the others
18 are reassured that their bodies are not put at risk to become ugly by being close to the ugly
19 body. In this way, disability is magnified and exaggerated, leading to being considered an
20 illness that renders disabled people incapable and less worthy.
21
22
23
24
25
26

27
28
29 There were people that didn't come near me, and I could feel they were keeping
30 distance; or when we were having coffee break at work they would stare and ask
31 "what's that on your arm? Is it contagious?" (Anna)
32
33
34

35
36 Moreover, it is assumed that only the beautiful body is acceptable because the ugly body is
37 pitiful, laughable, and condemnable. The gossip and the negative reactions of others prompt
38 disabled people to participate less in social life.
39
40
41
42

43
44 Cyprus' (society) feels uncomfortable when dealing with disability. Their
45 approach is centered around "It's such a pity". (Giorgos)
46
47

48
49 Cypriots love gossiping, so once they see you (being a disabled person) they start
50 gossiping and laughing. This behavior has stopped me from visiting the shopping
51 mall anymore. The mall has opened ages ago, and I've only been there twice.
52
53
54
55
56 (Savvas)
57

58
59 Moreover, it is postulated that the ugly body implies less intelligence, lower skills and
60

1
2
3 incapacity, compared to the whole and beautiful and thereby coveted and worthy body.
4
5

6 In Cyprus, people are still prejudiced against people with disabilities. Disabled
7
8 people are still perceived as incapable of being educated like everyone else and
9
10 hence are assumed not to be able to perform well in the workplace. (Koula)
11
12

13 *Work environment*

14
15
16
17 When the ugly body is set in the workplace, it is contrasted with the beautiful body that is
18
19 considered more capable and skilled. For this reason, some colleagues do not support
20
21 employees with ugly bodies, since it is believed that disabled bodies do not fit the workplace.
22
23

24 (moaning) At the early stages of my career, I encountered hostile behaviors. My
25
26 colleagues grew hostile to me, driven mainly by envy, and didn't help or support
27
28 me about my problem. (Vyronas)
29
30

31
32 On the other hand, when people with ugly bodies have skills and better paid jobs, they are
33
34 accused of lying or pretending that they are disabled, since the ugly body deserves a lower
35
36 place in social hierarchy and a low paid job. Others' attitudes seem to be modified according
37
38 to the disabled employee's gender. Thus, when the employee is a man, others assume that
39
40 having a good job is related to nepotism and use of illicit means.
41
42

43
44 Overall, their behavior would be like: "How come and you work here? You are too
45
46 young, a fresh graduate, how come and you managed to get this position?". There
47
48 is this need for justifying everything, all the time; justifying why you were eligible
49
50 to work as a teacher based on special criteria. (Vyronas)
51
52

53
54 Being a woman renders the workplace a much harder arena, since employers attribute
55
56 less abilities and mental skills more easily to the female ugly body.
57
58

59 I have a professional certificate and I show this to various potential employers and
60

1
2
3 just because they see I have a mobility impairment, they get confused and assume
4
5 that I am mentally disabled. (Koula)
6
7

8 *Family*

9
10
11 Family has a crucial role in determining what the disabled body is, since it is assumed that the
12
13 worthy body must be whole, able and beautiful. Thus, family reproduces stereotypes and
14
15 recycles prejudice against the ugly body.
16
17

18
19 This is a matter of improper discipline methods. Parents convey to their children a
20
21 plethora of misleading information about people with disabilities, and hence the
22
23 latter are repelled. This feeds a vicious circle. (Koula)
24
25

26
27 The coveted body for families then is the whole body; in contrast, when the ugly body is present
28
29 in the family, distress and despair shadow family relations.
30
31

32
33 When I was in bed, my mother would start crying in front of me, and had
34
35 meltdowns roaring “This is such a pity”. She gets anxious all the time. (Savvas)
36

37 *Engendered bodies*

38
39
40 It is noteworthy that the male ugly body is a source of greater sorrow, because it is not
41
42 compatible with the Cypriot hegemonic masculinity standard (Connell and Messerschmidt,
43
44 2005), of being or at least looking, strong and competitive. For this reason, having an impaired
45
46 and disabled male body evokes grief and despair. In fact, disability seems to have a greater
47
48 effect on masculinity compared to other identities (i.e. femininity), for masculinity is constantly
49
50 challenged and in need of proving (Sang, Richards and Marks, 2016), and that because of the
51
52 accumulation of masculine capital, which disabled men may find problematic (Wilde, 2004).
53
54 As Woodhams et al (2015) explain, disabled men cope with an increased pay penalty than other
55
56 marginalized groups, including women. Indeed, there is a tension between hegemonic
57
58
59
60

1
2
3 masculine traits of autonomy and independence and the requirement for aid of others
4 necessitated by disability (Shuttleworth et al., 2012). For men with visible disability, gendered
5 interpretations of work can lead in being linked to feminized traits such as helplessness (Mik-
6 Neyer, 2015).
7
8
9
10
11

12
13 For my father, my accident was the end of the world. He couldn't accept my
14 condition. He had dreams for me, and I was their only child, he wanted his son to
15 be strong. I was going to become a football player. And then nothing. I could do
16 nothing. (Vyronas)
17
18
19
20
21

22
23 *How disabled people shape their body and embodied self in order to fit into the social and*
24 *work life?*
25

26
27 Data presented here suggests that disabled people compare their bodies with the 'normal' body
28 and judge their abilities through social interaction and the others' reactions to disability. As a
29 result, they develop a negative identity and they try to fit into the social and work life by hiding
30 the ugly body. In contrast, some disabled people accept their ugly body and fit in by disclosing
31 their ugliness, which is presented as an oxymoron characteristic of beautiful people or as a
32 permanent situation.
33
34
35
36
37
38
39

40
41
42 *Comparing the ugly with the 'normal' body*
43

44
45 Comparison with the 'normal' body seems to define how people with ugly bodies perceive
46 themselves and shape their identity, due to concerns that they would be compared to their
47 previous "able" self.
48
49
50

51
52 People knew me when I was normal. How can I face them now and see me like
53 this? (Savvas)
54
55
56

57
58 *Social interaction*
59
60

1
2
3 Social interactions orientate disabled people's thoughts towards the realization that their body
4 not only deviates from the norm, but also has negative characteristics. Since others believe that
5 the disabled/ugly body is inferior to the beautiful body, others feel pity about disabled people
6 and think that it is impossible for someone to live with an ugly disabled body.
7
8
9
10
11
12

13 There are people who would feel pity for you, or sadness, or admiration; people
14 who would come to you and ask you "Wow mate, how are you coping with this?"
15
16
17

18 (Savvas)
19

20 Thus, the emotional state of people with ugly bodies may be defined by others, who focus on
21 the ugly characteristics of the person's body and not their personality. As a result, disabled
22 people feel uncomfortable, inferior and less worthy because of having a not acceptable body.
23
24
25
26
27

28 People who want to socially interact with people with disability, should not think
29 that they have disability! They should not keep reminding them of their disability,
30 causing them to feel uncomfortable and inferior. (Koula)
31
32
33
34
35

36 *Personal identity* 37

38 Some participants in the current study reported that once they internalize that their body
39 deviates from the norm, they formulate a personal identity of shame, embarrassment, and often
40 guilt. Consequently, they decide that their ugly body is also not worthy and therefore it ought
41 to be hidden and isolated.
42
43
44
45
46
47

48 I quit school, because I thought that my peers would make fun of me; that made
49 me feel inferior and led me to decide to never go back to school again. (Marios)
50
51
52

53 By keep repeatedly talking about it (disability), I feel like I am trying to justify it.
54
55

56 As if I am personally guilty of things that went irreversibly bad. (Vyronas)
57
58

59 *Hiding the ugly body* 60

1
2
3 Participants recounted how the negative stereotypes and the consequences that accompany the
4 ugly body affects both social and working lives and hence they often people try to hide and
5 conceal the ugly characteristics, even from their families.
6
7
8
9

10
11 I dragged myself in the grocery store! I dragged my leg, and I assumed that had I
12 told them, they would have fired me! So, I kept hiding and hiding. And it wasn't
13 because of low self-esteem; I was just afraid that if I had revealed my disease, I
14 would lose my job. (Anna)
15
16
17
18
19

20
21 My parents have no idea. I just tell them that I have some problems with my
22 vertebra, since they know that I always had some vertebral problems due to playing
23 basketball when I was younger. (Giorgos)
24
25
26
27

28
29 Yes. I didn't go anywhere! After I returned home (from the hospital), it took me so
30 long to go out... I don't know, I felt that... That if I went somewhere, people would
31 laugh at me, and I didn't like that... So, I stayed in the house. And I withdrew into
32 myself. (Marios)
33
34
35
36

37
38 Yes. People with disabilities are hiding in their shells. They hide it (their disability),
39 they hide in their shells. They have a complex. Complex. That's clear. Inferiority
40 complex. (Giorgos)
41
42
43
44

45 Other people try to imitate characteristics of the beautiful body in order to feel included.
46 Usually the priority is to appear as whole.
47
48
49

50
51 With the new hand I have, this artificial limb, you have to take a closer look to see
52 it... Before (the prosthesis) yes, I used to have my hand always in my pocket, but
53 after acquiring this artificial one, it doesn't bother me that much. (Ntinis)
54
55
56
57

58 I tell them that I broke my leg. So, everyone who sees me with the crutches,
59
60

1
2
3 assumes that I broke my leg. I went to the carnival and they kept asking me: “What
4 are you dressed up like? One-legged man?” (laughing). And I told them, “yes; one-
5 legged man” (smile). (Savvas)
6
7
8
9

10 ***What are the implications of acknowledging a disabled body as ugly?***

11 *Engendered stereotypes at the workplace*

12
13
14
15
16
17 Lack of awareness and gender stereotypes may result to misperceptions of the ugly body,
18 which, in the case of men, is considered by employers and colleagues as not worthy, not skilled
19 and not functionable. Ironically, the criterion to judge a disabled male teacher’s ability is not
20 their level of knowledge but rather their strength and ability to move around, **as a hegemonic**
21 **male trait. There is therefore a disembodiment noticed in occupations where intellectual ability**
22 **is required (i.e. academia); individuals’ brains and bodies are treated differently and as separate**
23 **entities (often the first without considering the presence and needs of the second).**
24
25
26
27
28
29
30
31
32

33
34 I once went to a school, before the principal even met me, he asked “can you go up
35 the stairs?”. I didn’t know what to say. Namely, what matters is to be able to climb
36 the stairs! (Vyronas)
37
38
39

40
41 Well look, when they see someone with special needs, they imply that he is bad in
42 his job, period. That’s how they learnt to think; but that’s pure ignorance. (Giorgos)
43
44
45

46 Being male and having a kinetic disability is also a source of disrespect on behalf of the
47 students, who make fun of their wheelchair mobile disabled teachers.
48
49

50
51 I had a friend who was a teacher on a wheelchair. He had many problems with his
52 students. They used to laugh at him, make fun of him; they were very naughty and
53 making so much noise that he couldn’t teach. (Marios)
54
55
56
57
58

59 *Ugly as weak and incapable*

1
2
3 In contrast to the beautiful body, the ugly body is also considered weak, inferior and incapable.
4
5 Therefore, it is believed that the ugly body ought to be excluded, as not fitting the normal,
6
7 beautiful and capable world.
8
9

10
11 It was my third day at school as a teacher, and they asked the School Inspector to
12
13 check upon me and verify I could perform my duties well. That was the parents
14
15 through the female School Principal. I felt devastated. That before having seen how
16
17 I perform, they decided I wasn't worthy. I was so offended by this. Before they see
18
19 me, "you are not good enough, you should go!" (Vyronas)
20
21

22
23 Exclusion may be induced through labelling, too.
24
25

26
27 Well, there are people who see you like everyone else; others who see you and
28
29 pitifully say "poor guy"; others who... Well, that's something I experienced three
30
31 times at school. The teacher asked, "where is that lame?". That got me furious, and
32
33 to avoid going after her, I left the classroom and she went "where are you going,
34
35 lame?". Do you get my point? (Savvas)
36
37

38
39 However, acceptance and inclusion are important for people with ugly bodies as a matter of
40
41 equity.
42
43

44
45 So, when you find positive reactions, you are encouraged because you feel that
46
47 they see you as normal, they don't see any difference, and that you enjoy the same
48
49 service...(Koula)
50

51 *Body as a source of pain*

52
53

54 For many disabled people, the ugly body is considered a source of physical and mental pain
55
56 and an unspeakable bad luck.
57
58

59 Well, it's always on your mind that... There are times that you keep asking yourself
60

1
2
3 “but why? Why do I have such a bad luck, and I am ...”. (Ntinios)
4
5

6 *Body as a barrier*
7
8

9 In addition, the ugly body may be perceived as a barrier to participation in social and work life,
10 since it physically limits the person that lives in a world constructed by beautiful and not
11 disabled people.
12
13
14

15
16
17 It changed (my) life! My life is completely different because of the disability!
18

19 There were other things I could do before it, and others after it. I am what I am...
20

21 Nowadays, I know my limits. I don't do, I don't ask for anything beyond my
22 capabilities... I can't want, what I can't do. (Vyronas)
23
24
25

26 When the ugly body is not a barrier for accomplishing tasks at the workplace, people with ugly
27 bodies feel less uncomfortable.
28
29
30

31
32 When you feel that you can do the task, you don't feel uncomfortable (anymore).
33

34 (Marios)
35
36

37 **Discussion**
38
39

40 By drawing on the related theoretical development of symbolic embodiment, the data presented
41 here reveal how the coveted beautiful body is constructed by cultural, social, economic, family
42 and personal factors. Thus, immersion in the perceptions of disabled people disclosed the
43 bifurcation of beautiful-worthy vs ugly-not worthy body that ought to be excluded,
44 marginalized and hidden, in contrast to the former that is the coveted and cherished body. The
45 study extends theoretical understandings of gendered experiences of embodiment, and the
46 mechanisms by which gendered stereotypes of ableism are maintained. Specifically, the data
47 suggests, within this context, that at the first level of the shaping process, the owner of the
48 disabled/assumed as ugly body compares it with the norm, i.e. the acceptable body, and decides
49
50
51
52
53
54
55
56
57
58
59
60

1
2
3 what their body is, based on non-disabled people's judgements. If the owner of the body
4 decides that it deviates from the norm and label it as ugly, as the norm dictates, then at the
5
6 second level the disabled person explores the available shaping sources and means, in order to
7
8 define whether the body can be not ugly and thereby reach the norm. To this end, the disabled
9
10 person may try to hide or conceal their disability. At the third level, the owner of the perceived
11
12 as ugly body evaluates the shaping efforts and assumes whether their body will eventually be
13
14 or not ugly. If the person assumes that the body cannot change and will be ugly/not worthy,
15
16 then they usually withdraw from social and work life. Importantly for disability and managerial
17
18 studies, some disabled persons may overcome the oppression and decide to shape the meaning
19
20 of the beautiful-worthy/ugly-not worthy body, instead of the body itself.
21
22
23
24
25
26

27 The picture is complex for disabled men and women, for example, as the effects of ugly bodies
28
29 are not homogenous. Thus, for men, the perceived as ugly body is not worthy because it does
30
31 not correspond with the hegemonic male ideal which in the post-colonial masculine society
32
33 reflects the strong and 'whole' man, who is considered the head and the guardian of the family.
34
35

36 For women, the perceived as ugly body is identified with the not worthy body, because it
37
38 contradicts the prevalent notions about femininity; in the Cypriot context, femininity is based
39
40 on external beauty and ability to nurture and serve the family. According to Ghosh (2010), the
41
42 female disabled body is created "as an embodiment of corporeal insufficiency and a repository
43
44 of social anxieties about control and identity" (p. 58). It is therefore imperative to further
45
46 explore the historical and spatial differences, changes and stabilities in how bodies and
47
48 embodiment are perceived and understood across time and space; in this way, it would be more
49
50 likely to understand the intersection of gender, employment, social exclusion and the
51
52 disabled/assumed as ugly body.
53
54
55
56

57 The tension between the beautiful and the ugly body reflects the philosophical debate about the
58
59 relationship between the concepts of beauty and ugliness, i.e. whether they constitute two
60

1
2
3 independent and discernible categories or opposite extremes of one continuum (McConnell,
4 2008). It also extends the discussion initiated by ancient Greek philosophers about the
5 importance of being beautiful in order to be included in social life and be entitled citizenship.
6
7 Excluding the different was also a common practice since that time, as evident in the distinction
8 between ‘Greeks’ and ‘barbarians’, i.e. ‘non-Greeks’. Ironically, stereotypes and cultural ideals
9 may serve as the knot that ties groups of people together (Gilleard, 2007). Even though not all
10 stereotypes are of real value in contemporary Cyprus, the idea of the beautiful/worthy vs
11 ugly/not worthy seem to have deeply penetrated not only the Cypriot *ethos*, but also the culture
12 of other countries as well, eventually becoming *habitus*.

13
14
15 **Although limited, the extant literature suggests that** representations of disabled people as ugly
16 and therefore not worthy portray subjugated bodies not only as inadequate, deficient and weak
17 but also as redundant and expendable (Mays, 2006). **The current study reveals** participants’
18 concerns about being rejected by employers, partners, family and friends because of their
19 bodies that did not fit constructions of the ideal body and could never reach the coveted body,
20 despite their efforts to ‘heal’ or conceal the perceived damage. Thus, people with diverse bodies
21 become subordinated, othered and perceived as less than whole persons. As a result of the
22 oppression, people with perceived as ugly bodies are excluded from social interactions and
23 have restricted access to resources; at the same time, they are influenced to shape a negative
24 identity and make sense of their own experiences through the others’ eyes (Oliver, 1996).
25 However, some of the participants managed to resist the oppression by shaping the meaning of
26 the disabled body instead of the body itself.

27 28 29 **Conclusion**

30
31
32 In conclusion, since the body is a locus where nature and culture meet (Shiling, 2017), it is not
33 easy to distinguish the natural and cultural influence in the embodiment of social identity.

2
3 Based on our analysis, it seems that the perceived as ugly body may be framed as problematic
4 in some cultures, like the Cypriot one, with implications for equality and diversity in
5 professional settings. Since the body then constitutes a political site, it may be understood and
6 experienced in relation to the social construction of what is normal (Mays, 2006). Thus, politics
7 of appearance, representation and labelling in Cyprus seem to have been deeply rooted in a
8 long-standing constructed normality that has been identified with the beautiful body. Besides
9 the Western perspective that discusses white colonial interpretations (e.g. Simpson and Pullen,
10 2018), our study provides insights that explain the embodiment of social identity in a culture
11 that resembles ancient Greek values about the importance of *kallos* in solving the bifurcation
12 of good/bad and able/disabled.
13
14

15
16
17 Yet, representations of beauty impact both the social beliefs about the other's body and the
18 individual perceptions about their bodies. In order to manage the emerging tensions between
19 beautiful and ugly bodies, it seems important to consider, understand and negotiate the
20 discourse that contributed to the defining of beauty (Heiss, 2011). In this way, it would be
21 possible to create positive identities for the oppressed owners of perceived as ugly bodies and
22 dismantle the barriers to inclusion in the workplace and social life of people labelled as ugly-
23 disabled-not worthy persons.

44 This paper contributes to the literature in two ways. Firstly, it adds to understandings of the
45 experiences of disabled men and women in other than the dominant Western -oriented context.
46 It reveals experiences are complex and different based on gender, despite the fact that
47 marginalization is evident. Secondly, the paper demonstrates drawing on social embodiment
48 model the gendered and ableist aspects of social beliefs and working practices. Just as
49 homosociality can be seen as a gender practice, related to hegemonic masculinity (Collinson
50 and Hearn, 1994), the current study confirms it is also an ableist practice (Sang, Richards and
51 Marks, 2016). This study suggests understandings of disabled people's experiences of social

3 and work lives, and how gendered exclusion at work is maintained, will benefit from drawing
4
5 on both gender and disability theorizing. Doing so will help uncover not only gendered
6
7 practices within organizations and societal values which underpin hegemonic masculinity, but
8
9 also ableist practices (Campbell, 2008) which marginalize disabled individuals, and
10
11 institutionalize a disembodiment between ugly/ beautiful bodies and able/unable minds.
